Press Release

GLI Systems Inc. Wins 2008 Earth Day Sustainable Product Award.

RainTube product is recognized for outstanding environmental achievement in four categories.

Jacksonville, OR, April 22, 2008: GLI Systems Inc. of Jacksonville, Oregon, manufacturer of the RainTube Rain Control System, has been awarded the 2008 Green Building Pages Earth Day Benchmark Sustainability Awards for Outstanding Achievement in Environmental and Social Sustainability. The awards were presented to RainTube for outstanding achievement in four of seven categories including:

- The top award – The Sustainable Product Award – for the highest overall product sustainability rating,
- The Global Climate Change Award--for durability and efforts to reduce greenhouse gasses during manufacture and distribution.
- The End of Product Life Award--for providing comprehensive end-of-life strategies for RainTube products and...
- The Installation, Use and Maintenance Award—for incorporating design elements that reduce environmental impacts during installation, use and entire product of life.

For Immediate Release, April 22, 2008

more

RainTube was recognized for exemplary performance according to the Green Building Pages rigorous Benchmarking Sustainability evaluation criteria. The Green Building Pages is a leading building products certification organization that provides consumers, architects and building contractors with internet-based guides and resources supporting sustainable building design and information about green building products. Green building, an ecologically sound method of residential and commercial construction, has become a major area of interest and concern among consumers and the building industry worldwide. The Green Building Pages certification database, which is consistent with the American Society for Testing and Materials (ASTM) criteria, placed RainTube in the lead position among the sustainable building products of some of the nation's leading manufacturers. RainTube use also generates LEEDS points for builders and owners seeking "green" certification for their projects.

RainTube is an effective, low-cost gutter protection system made in the USA from 100% post-consumer recycled materials. RainTube helps protect homes, apartments and commercial buildings from water damage from clogged gutters, reduces fire risk from gutter debris in compliance with new fire prevention building codes, reduces maintenance and promotes cleaner rain water harvesting systems. RainTube was awarded Sustainable Product of the Year in 2007 and that same year also named one of the top ten green building products.

Steve Spratt, co-founder of GLI, said "We are delighted to be recognized with these important awards. The fact that our small organization has been able to elevate the level of awareness and importance of sustainability in our industry is a source of great satisfaction to everyone in our company. Meeting the high criteria of the benchmark Product Sustainability Awards set a standard we will continue to emphasize in all our business operations." Spratt went on to note "Green Building standards are increasingly important to consumers today. It is gratifying that RainTube has been recognized for making a contribution to the planet while helping homeowners preserve and increase the value of their buildings."
